Q: Postgresql: Difference between estimated column and actual row count I have two tables, A and B. Both are indexed with a unique index on my primary key. It took me a while to realize that a select query like this select * from A where... gets the number of rows in the table, not the number of estimated rows for that query: select count(*) from A where 1 = 1 On the other hand, a query like this select * from A where... finds the estimated number of rows: select count(*) from A where 1 = 1 This seems to hold for both indexed
